PROFESSIONAL SUMMARY

Backend Software Engineer specialized in automation systems, API integrations, AI-powered platforms, distributed services, and scalable backend architectures. Experienced building RESTful APIs, asynchronous workflows, webhook-based integrations, queue systems, RAG pipelines with vector search, and production-grade AI agent systems.

I integrate AI with deterministic code — guardrails, validation, and caching layers ensure LLM calls are optimal, cost-efficient, and predictable. Strong focus on clean architecture, SOLID principles, system reliability, test coverage (3,000+ tests across portfolio), and production-ready solutions.

CORE COMPETENCIES

Backend Development · API Integration · RESTful APIs · Distributed Systems · Automation Systems · Event-Driven Architecture · Queue Systems · AI Integration · RAG · Vector Search · LLM Orchestration · System Design · Software Architecture · Webhooks · Async Processing · Database Design · CI/CD · Docker · Redis · PostgreSQL · SQL · FastAPI · Flask · Python · Node.js · Microservices · Scalable Systems · Testing

TECHNICAL SKILLS

Languages: Python, Java, JavaScript, TypeScript, C#, SQL, PHP

Frameworks & Libraries: FastAPI, Flask, Node.js, React, SQLAlchemy, Alembic, Pydantic v2, dependency-injector, httpx, Spring Boot, Spring Data JPA, Spring Kafka, Hibernate, Maven, Django, Laravel

Databases & Infrastructure: Apache Kafka, Redis, PostgreSQL, Flyway, SQLite, Qdrant (Vector DB), Docker, Docker Compose, Gunicorn, APScheduler, Render

AI & Integration: Claude API (Anthropic), Voyage AI, Langfuse, RAG, Vector Search, Guardrails, LLM-as-Judge, Prompt Caching, Batch API, SSE Streaming, n8n, Airtable, BigQuery, REST APIs, Webhooks, SendGrid, Telegram Bot API

Testing & Quality: pytest, pytest-asyncio, pytest-cov, Playwright, mypy, Ruff, pre-commit, GitHub Actions, JUnit 5, ArchUnit, Testcontainers, architecture tests (AST and ArchUnit)

Architecture & Practices: OOP, SOLID, Clean Architecture, Hexagonal Architecture (Ports & Adapters), MVC, Repository Pattern, Composition Root, Event-Driven, Pipeline, Circuit Breaker, Transactional Outbox, Idempotent Consumer, Dependency Injection, Plugin Systems, CI/CD

Development Tools: Git, GitHub, Postman, VS Code

PROFESSIONAL EXPERIENCE

Software Developer2022 – Present

Freelance

- Built and deployed 7+ production-grade backend services on Render, covering fintech AI agents, API gateways, distributed task queues, notification engines, and monitoring systems.
- Designed event-driven architectures using composable pipelines, pub/sub buses, circuit breakers, and repository patterns — with 3,000+ combined tests across the portfolio.
- Developed a fintech RAG agent with semantic search (Qdrant), deterministic guardrails, n8n orchestration, and LLM-as-Judge feedback loops.
- Delivered custom backend systems, automation solutions, and API integrations for international clients through Fiverr, Upwork, and direct referrals.

Systems Architecture & Automation EngineerNov 2024 – Mar 2026

Del Mundo a Tus Manos

- Designed and maintained a production-grade operational platform including database architecture, automation workflows, operator interfaces, and third-party API integrations.
- Reduced operational processing time from approximately 10 minutes to 5 seconds across ~2,100 monthly transactions.
- Built and maintained a production Airtable ecosystem with 11 relational tables, ~115,000 records, and 48 active automations.
- Integrated external platforms including Amazon, Mercado Libre, Tienda Nube, ARCA, messaging services, and Laravel/PHP APIs using REST APIs and webhooks.
- Developed internal operational tools including QR label generation systems and AI-assisted WhatsApp routing solutions.
- Collaborated directly with operational teams to translate business requirements into scalable technical solutions.

Game Developer2021 – 2024

Freelance

- Developed games, gameplay modifications, and custom mechanics on commission using Unity Engine and Unreal Engine.
- Built reusable systems and modular frameworks including battle systems, AI controllers, and gameplay tools.
- Gradually transitioned toward developer tooling, focusing on backend systems and automation platforms.

Programming Instructor2022 – 2024

Freelance

- Taught C#, JavaScript, Python, C++, Unity, and Unreal Engine to students with different technical backgrounds.
- Conducted technical assessments and created personalized study plans adapted to each student's goals.
- Mentored students through backend programming, OOP, debugging, game development, and applied mathematics.
- Provided code reviews, technical guidance, and practical project-based support.

PROJECTS

CIRI Chargeback Agent
github.com/federicomoroz/ciri-api-aux-sourcecode · ciri-chargeback-agent.onrender.com/panel · federicomoroz.github.io/en/projects/agente-contracargos/
Fintech AI agent that automates chargeback resolution using RAG with semantic search (Qdrant + Voyage AI), deterministic guardrails ("code decides, LLM explains"), and n8n as explicit orchestrator (54 nodes). LLM-as-Judge dual-threshold feedback loop (9.1/10 score). Semantic cache for ~20% LLM cost reduction. Policy CRUD with auto-reindexing (zero downtime). Interactive testing panel with SSE streaming. Langfuse observability.
FastAPI · Claude API · Qdrant · Voyage AI · n8n · Langfuse · SQLite · 1232 Tests

AI Training Plan Generator
federicomoroz.github.io/en/projects/mega-training-system/
Multi-discipline web platform, in daily production use, that generates professional training plans in real time using the Claude API. SSE streaming, circuit breaker on AI calls, dependency injection container, idempotency layer, plugin architecture (new disciplines without touching core), Google Drive sync, drag-and-drop class editor, and full member CRUD. PDF/CSV/HTML export.
Flask 3.0 · Claude API · SSE · SQLite · Docker · dependency-injector · Pydantic v2 · 1704 Tests

Task Queue
github.com/federicomoroz/task-queue · task-queue-tpdz.onrender.com · federicomoroz.github.io/en/projects/task-queue/
Distributed task queue system with a FastAPI server, Redis broker (LPUSH/BRPOP), SQLite persistence, and horizontally scalable worker pool. Multi-container Docker architecture — workers scale with --scale worker=N without code changes. Supports multiple task types and retry logic.
FastAPI · Redis · SQLAlchemy 2.0 · APScheduler · Docker · 37 Tests

Order Outbox Service
github.com/federicomoroz/order-outbox-service · federicomoroz.github.io/en/projects/order-outbox-service/
Two independently deployable microservices on a Maven reactor. Transactional Outbox on the producer side: the event is written in the same transaction as the order and a publisher dispatches it to Kafka, so an order cannot exist without its event. On the consumer side, an idempotent consumer discards redeliveries by event key. The hexagonal architecture is not asserted — ArchUnit verifies it, and the test fails if a layer imports one it has no business importing. Flyway migrations and integration tests with Testcontainers.
Java 21 · Spring Boot · Apache Kafka · PostgreSQL · Flyway · ArchUnit · Testcontainers · JUnit 5 · 72 unit tests

Shipping Quote
github.com/federicomoroz/shipping-quote · shipping-quote.onrender.com · federicomoroz.github.io/en/projects/shipping-quote/
Shipping rate quoter with an end-to-end hexagonal architecture: every request emits its own ordered trace —entry, adapter, port, use case, domain and back out— and that trace is returned in the response. Three simulated carrier adapters on a single class configured by composition; one fails on purpose and the use case answers with two quotes out of three. Money in Decimal with an explicit ROUND_HALF_UP.
FastAPI · SQLAlchemy · Alembic · httpx · Pydantic · pytest-asyncio · 31 Tests

Rate Guardian
github.com/federicomoroz/rate-guardian
API gateway with sliding-window rate limiting (Redis sorted sets), Redis-backed circuit breaker (CLOSED/OPEN/HALF_OPEN), transparent HTTP proxy, and event-driven logging via pub/sub bus. The gateway never imports the logger directly — fully decoupled via EventManager.
FastAPI · Redis · Docker · Event-Driven Architecture · 202 Tests

Notify Router
github.com/federicomoroz/notify-router
Multi-channel notification routing engine with configurable rules and event dispatching to Email (SendGrid), Telegram, Slack, and generic webhooks. Pipeline + Strategy + EventManager architecture. Single-page admin UI for managing channels, rules, and events without CLI access.
FastAPI · SQLite · httpx · APScheduler · SendGrid · Telegram Bot API

Dollar Tracker
github.com/federicomoroz/dollar-tracker
Automated exchange rate monitoring service that polls live Argentine dollar rates, stores historical data, fires email alerts when prices cross user-defined thresholds, and delivers configurable periodic reports (hourly, daily, or weekly) — fully unattended.
FastAPI · PostgreSQL · SQLAlchemy · APScheduler · SendGrid · Docker

Webhook Logger
github.com/federicomoroz/webhook-logger · webhook-logger-9paz.onrender.com
Backend service for receiving, persisting, and auditing webhook events from any source (GitHub, Stripe, MercadoLibre, etc.). Stores payload, filtered headers, source IP, and timestamp. REST API for full event history and a built-in outbound HTTP request tester.
FastAPI · SQLite · SQLAlchemy · httpx · MVC + Repository Pattern

Job Board Scraper
Playwright-based scraper that crawls job listings, evaluates fit against a configurable skill and title profile (with blacklist support), and generates structured match reports. Designed for automated job discovery with minimal manual filtering.
Node.js · Playwright · Automated Reporting

envCheck
github.com/federicomoroz/envcheck
Zero-dependency CLI tool that validates a .env file against .env.example — reports missing variables, empty values, and undeclared keys before they cause runtime errors. Supports custom file paths via CLI flags.
Python · CLI · Zero Dependencies

RPG Turn-Based Battler System
github.com/federicomoroz/RPG-Turn-Based-Battler
Modular, data-driven turn-based battle framework built in Unity (URP, 2D). Drop-in architecture lets developers add new skills, units, and controllers without touching existing code. Implements a 4-phase FSM (Anticipation → Execution → Outcome → Resolution), a Chain of Responsibility damage pipeline, parry-window system with reactive player input, configurable projectile system, status effects, and a generic 3-type object pooling system with reflection-based auto-discovery of poolable types.
Unity · C# · URP · FSM · Template Method · Strategy · Chain of Responsibility · Object Pool
